

SDLC - Overview:-

Building Software Step-by-Step:-

1. Requirement

"What do we need?"

- Gather and analyze user needs.
- Set clear project goals and expectations.

2. Design

"How will it work?"

- Developers start coding based on the designs.
- Transform ideas into working software.

3. Implementation

"Let's build it!"

- Developers start coding based on the designs.
- Transform ideas into working software.

4. Testing

"Did we get it right?"

- Identify bugs and issues early.
- Validate that requirements are fully met.

5. Deployment

"Ready for the World!"

- Release the software for real-world use.
- Monitor performance and plan updates.

How They Interconnect:

Each phase depends on the success of the one before it.

Skipping or rushing a phase increases risk. Communication, feedback, and iteration keep the SDLC cycle healthy and strong!

"SDLC is not a race - it's a guided journey towards success!"
