

TASK-1

Objective:- Create a simple use-case diagram for a Library Management System.

• Steps to Perform:

1. Identify Actors

- Think about the people or systems interacting with the Library management System.

• Example Actors:

- Librarian (Manages books and user accounts)
- Member (Borrowers and returns books)

2. Define Use Cases (Functionalities)

- List out what major tasks or services the system provides to these actors.

• Example use Cases:

- Search Catalog - Member searches for books.
- Check Out Book - Member borrows a book.
- Return Book - Member returns a borrowed book.
- Manage Inventory - Librarian updates book records, adds/removes books.

3. Draw the use-Case Diagram

- Place actors on either side of your drawing (Stick figures or simple icons).
- Draw ellipses (Ovals) to represent each use case (the system's actions).
- Connect each other to the use cases they interact with using straight lines.
- (Optional) Add the system boundary box if you want to show that the use cases belong to the system.

4. Review for Completeness

- Double-check that every major user action is required.
- Ensure connections are logical and clear - no actor should be left isolated.
